

Let's build an „eternal terrarium“!

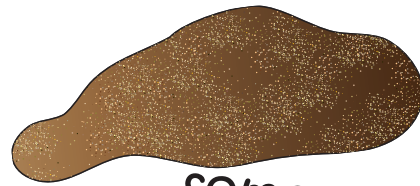

What you need:

an empty jar

some gravel

some soil

a little bit of
water

some mosses and plants

a rubber animal

And off we go!

1. take your empty and clean jar

2. fill it with about 2 fingers width of gravel

3. pour about 3 fingers width of soil on the gravel

4. place the mosses and plant trimmings as you like

5. let your rubber animal move in

6. add a little bit of water

7. Close your jar tight

And how does it work now?

Your jar contains a complete, small ecosystem.

Place your jar on the windowsill. This way your plants will get enough sunlight to grow. Just make sure your jar doesn't sit in direct sunlight.

As the water in the jar evaporates, moisture will form on the glass and turn into „rainfall“. This should change back and forth during the day. If your jar is always steamy, then you should open it for a short time to air it out. If the glass doesn't steam up at all, then just add a few drops of water.

Your plants produce oxygen with photosynthesis.
You will quickly see how well they grow!

Keep your jar closed! Once you've reached the perfect balance, you can enjoy your terrarium for a very long time!

And what is the DGHT?

The DGHT (Deutsche Gesellschaft für Herpetologie und Terrarienkunde – German Society for Herpetology) is a nonprofit organization dedicated to promotion and research of nature and species protection for Amphibians and Reptiles, as well as their proper care and handling.

The four main pillars of the DGHT are nature and species protection, research, species-appropriate and knowledgeable care and information transfer.

In nature and species protection we support projects to protect populations of Amphibians and Reptiles, and the biotopes they inhabit, both in- and outside Germany.

Many of our members are active in universities, museums, zoos and public agencies, both in laboratories and in the field, thereby supporting research of Amphibians and Reptiles.

Qualified DGHT members work privately and together with zoos in successful breeding programs to bolster the populations of endangered species, ensuring genetic reserves and conservation of species.

Especially important to us is the exchange of information within our group and the transfer of knowledge in the public domain.

To learn more about the DGHT and its work, visit our website at <https://www.dght.de/>

If you would like to contact our regional members, you can visit <https://moenchengladbach-krefeld.dght.de> or visit one of our gatherings as soon as they resume.

And now greetings and have fun Crafting!
